

I am a Computer Science undergraduate at Vellore Institute of Technology with a specialization in Cloud Computing. Over time, I have developed a strong interest in web development and understanding how applications work in real-world scenarios, beyond just writing code.

Currently, I am working as a Python & Django Developer Intern at Indycium, where I mostly focus on backend development. My work involves building and improving APIs using Django REST Framework, connecting frontend components with backend services, debugging issues, and optimizing performance. I also collaborate with other developers and take part in code reviews, which has helped me understand how scalable systems are built in practice.

Earlier, I completed my industrial training at Prasar Bharati (All India Radio – Akashvani) in the IT department. During this time, I was exposed to day-to-day system operations, troubleshooting, and internal technical workflows. As part of this training, I worked on a Virtual Interview System, where I helped design the interview flow and worked on both frontend and backend logic, including handling audio and video responses. This experience gave me a practical understanding of how end-to-end systems are planned and executed.

I also worked on an Attendance Tracker project during an externship with Sopra Steria India, where I followed production-oriented development practices. This helped me understand structured development, validation, documentation, and teamwork in an enterprise-style environment.
